

STAB-O-MAT / STAB-O-BLOC - TT

| the column with telescopic outer tube

The height adjustability of STAB-O-MAT and STAB-O-BLOC gas springs depends directly on the guide length and therefore the length of the outer tube. An increased adjustment range inevitably results in a longer outer tube and thus in a higher lowest seat position.

The STABILUS **telescopic outer tube** overcomes this effect with an additional telescopic tube. This solution provides a large adjustment range with a low bottom seat position without compromising stability and guide properties.

Advantages:

- large adjustment range at a low minimal height
- full comfort
